Handling Instructions

■ Soldering

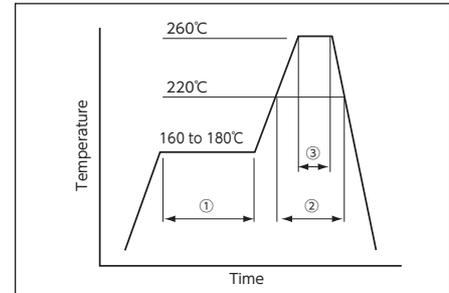

Our products are designed so they may withstand the same standard reflow soldering temperatures as most other electronics components. However, if the reflow temperature is higher than our specification allows, the performance may be affected. Avoid soldering the product at temperatures higher than specified.

For the reflow temperature profile of SMD products, refer to the figure below.

①	Preheat	160 to 180°C	120sec.
②	Primary heat	220°C	60sec
③	Peak	260°C	10sec. max.

※ The reflow temperature profile may vary depending on the product model, specifications and frequency range. Refer to the individual product specifications for details.

■ Cleaning

- General cleaning solutions or ultrasonic cleaning may be used to clean our crystal products, but verification tests are recommended prior to use.
- Tuning fork crystals resonate at frequency bands that are close to the washing frequency of ultrasonic cleaning machines and this may cause resonance deterioration in the crystal. Therefore the use of ultrasonic cleaning machines to clean tuning fork crystals should be avoided. After applying ultrasonic cleaning, the functionality of crystals should be verified by testing the performance of the end product.

■ Shock

Crystal products are designed to resist shock, but if the products receive excessive shocks or are dropped on the ground, be sure to check for any damages before using.

■ Mounting

〈SMD crystal products〉

Surface mount crystals are designed to be compatible with most automatic mounting processes, but some processes may exert excessive shock which may damage the crystal. Therefore test mounting of the crystal prior to mass production is necessary.

If there is a possibility that PCB may be warped, make sure the warping is not to such a degree that the crystal products' operating characteristics or soldering conditions will be negatively affected.

Avoid mounting and processing by Ultrasonic welding because this method has a possibility of an excessive vibration spreading inside the crystal products and becoming the cause of characteristic deterioration and not oscillating.

〈Lead type〉

When bending, forming, or mounting leaded crystal products be careful not to put too much pressure on the glassed part of the base, as it may crack and negatively affect the crystals' performance.

■ Storage

Storing crystal products at high temperatures or high humidity may deteriorate the soldering condition of pins. Do not store in direct sunlight or damp environments.

■ Others

〈Crystal Resonators〉

- When excessive voltage is applied to crystal resonators, their performance may be affected or the crystal blank may be damaged. When handling the product, use the product within the specifications provided.
- Negative resistance determines the tolerance margin of a circuit that oscillates the resonator. We recommend that the negative resistance be at least five times the standard series resistance for standard applications, and at least ten times the standard series resistance for automotive and safety applications.

〈Crystal Oscillators〉

- C-MOS is used for internal circuit of crystal oscillators. To prevent latch-up phenomena or static electricity, take careful note.
- Some crystal oscillators do not have internally connected bypass capacitors. When using the product, use a capacitor with a good high frequency characteristic of 0.01μ F between Vcc and GND (e.g. Ceramic chip capacitor) and connect it at the shortest possible distance. For details, refer to the specifications of each individual product.

〈Monolithic Crystal Filters〉

- Take care so that the input pin and the output pin do not close on the PCB.
- If the floating capacity of a PCB (on which a crystal filter is to be mounted) is too large, circuit tuning may be required to cancel out the excess floating capacity.
- When excessive voltage is applied to crystal filters, their performance may be affected or the crystal blank may be damaged. When handling the product, use at its input level equal to or less than -10dBm.

〈Optical Products〉

- Our products are manufactured in a dust-free environment. To keep them clean and dust free, keep them in a clean environment after they are unpacked.

RoHS/ELV Compliant Lead-free and Halogen-free products from KDS.

KDS is fully committed to environmental protection and has been proactively working to comply with the major environmental regulations such as RoHS Directive (Directive of the Restriction of the use of certain Hazardous Substances : 2011/65/EU and (EU) 2015/863), ELV Directive (End-of-Life Vehicles Directive : 2000/53/EC) and Halogen-free activities etc. The below spreadsheet provide the current status of the product compliance in each environmental regulations. How a quartz crystal device is made

The piezoelectric effect

In 1880, the Curie brothers, both physicists of France (the wife of Pierre, the younger Curie, was Madame Curie (Marie), famed for her discovery of radium), discovered the phenomenon of electric polarization as a result of applying mechanical strain to a plate of quartz crystal. This effect, referred to as the "piezoelectric effect," is an important phenomenon used in quartz crystal devices.

(B) Illustration of piezoelectricity

Growth of artificial quartz crystal

A quartz crystal device is produced from artificial quartz crystal; the reason for this is that artificial quartz crystal of high purity can be obtained on an industrial and stable basis, and that artificial quartz crystal can be processed into shapes suitable for further processing. Quartz crystal is grown in a special-steel oven, called an autoclave (shown in Fig. 3), under high-temperature and high-pressure conditions; this process takes several months. The natural quartz crystal that is recrystallized by means of hydrothermal synthesis is artificial quartz crystal.

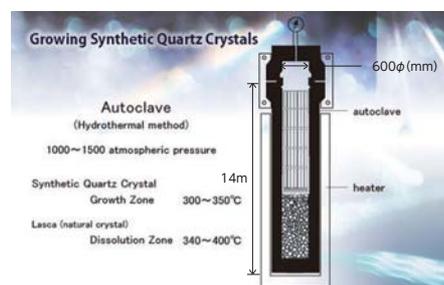

Fig.3. Autoclave

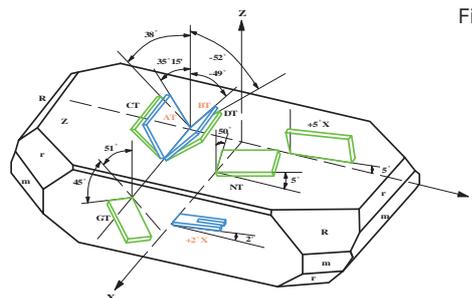

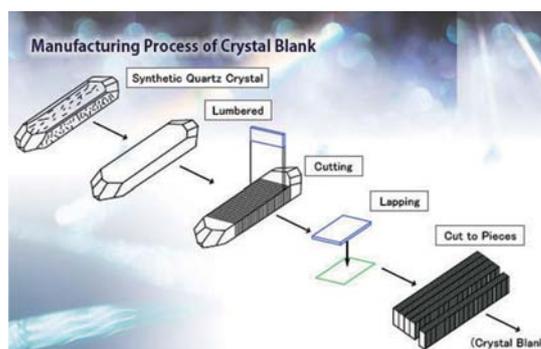

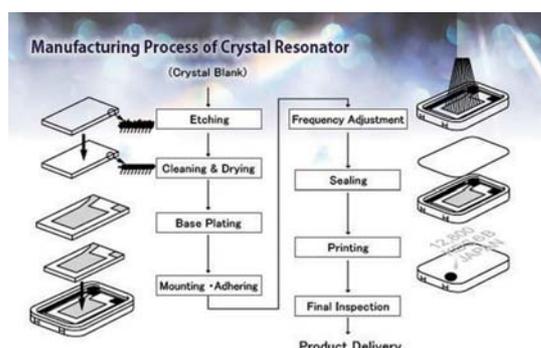

Fig.4. Designations of cuts from a piece of artificial quartz crystal

Process of manufacturing quartz crystal devices

A finished artificial quartz crystal is cut at an angle suited to its application; repeated grinding and cutting then turn it into a quartz crystal piece (a small plate-like chip of quartz crystal, it is usually called "Crystal blank"). The manufacture of a crystal blank is so important a process as to allow this crystal blank to practically determine the characteristic of a quartz crystal.

Several months after artificial crystal growth begins, the assembly process finally occurs. After the crystal surface has been cleaned, metal thin film is created on it to obtain a conductive surface, and the package is connected to the crystal blank. The crystal blank then undergoes final frequency adjustment and is packaged in a vacuum or in a nitrogen atmosphere to protect it from oxygen, moisture, and similar substances, which can affect it adversely. When all these steps have been completed, the crystal blank undergoes shipping inspection, is marked and then shipped.

Refer to "Handbook of Quartz Crystal Device, 5th ed. (QIAJ)" for each figure.

“Slim × Small × Smart” Crystal (Triple-S Crystal)

Mobile devices such as smartphones are demanded to be more powerful and multifunctional to enhance user convenience, requiring their component to be downsized and low-profiled. Inevitably, the sizes, shapes, and specifications of wearable devices and smart cards under development also require parts mounted on them to be downsized and low-profiled.

“Slim×Small×Smart” Crystal (Triple-S Crystal) forms a below-2016-size crystal device group expanding design possibilities under these circumstances.

New aspects such as newly-designed crystal chips, the mounting of crystal chips by a new process, and an optimized package design have enabled realization of a product of the world’s smallest and thinnest class, that comes with similar or better performance than currently running products. In addition to downsized and low-profile products, we will continue to realize products that respond to various specifications including high functionality, high-frequency performance, high reliability and low power consumption, thereby contributing to the downsizing and the enhancement of functionality in various devices.

Arkh.3G series

Arkh.3G SERIES

About Arkh.3G

Arkh.3G

The brand name "Arkh" is from arkhitekton, the ancient Greek from which architecture is derived. The Arkh.3G is a quartz crystal device that uses a completely novel third-generation (3G) structure. The implication of the use of architecture instead of the simpler structure represents our desire to express that the product is based on a more definite strategy and concept than before.

About the Structure and Manufacturing Process of the Arkh.3G

In the conventional structure, a quartz crystal element is held in a ceramic package by means of a conductive adhesive. In contrast, the Arkh.3G is arranged in a three-layer structure consisting of a lid, resonator, and base, the host of which is quartz crystal. With the outlines of the resonator and other parts having been formed by a photolithographic process, three quartz crystal wafers are bonded and diced into a wafer-level package. Thus the holder and resonator parts are formed into an integrated structure without the use of a conductive adhesive. This design has solved the challenges that the conventional structure needed to meet for product size reduction, namely, improved accuracy in conductive adhesive application and the provision of a margin for ensuring a quartz crystal element mounting location. Additionally, it is possible to reduce quality risks by carrying out processes ranging from wafer cleaning to bonding in a vacuum environment.

About Mounting and Usage of the Arkh.3G

The Arkh.3G can be soldered to circuit boards with a pick-and-place machine in the conventional manner. It can also be built into an IC package or used for wire bonding or molding.

* Note that, as with conventional products, the Arkh.3G is subject to resonance fracture or damage, depending on conditions such as ultrasonic cleaning and molding pressure. Therefore, it is necessary to check the Arkh.3G in advance under your particular operating conditions.

SMD Crystal Resonators / MHz Band Crystal Resonators

DX1008JS

Actual size □

■ Features

- 1008 size, height 0.13mm max.
Unprecedented extremely low-profile package using a novel structure
- Composed only of quartz crystal plates and metallic films without the use of a ceramic base
- Long-term high resistance to aging, due to avoiding the use of an organic conductive adhesive
- Reduced risk of the inclusion of foreign matter due to assembly in a vacuum environment

■ Applications

- Mobile communications and short-range wireless modules
- Wearable devices
- Automotive millimeter-wave radar

Crystal resonators

Crystal Resonators

Description

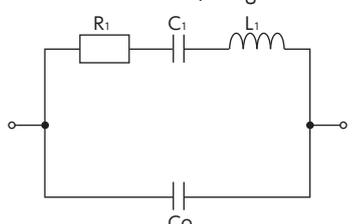

●MHz Band Crystal Resonators

A resonator using thickness-shear mode and has high stability during temperature variations. There are many packages and sizes available for various applications.

●kHz Band Crystal Resonators(Tuning Fork Crystal Resonators)

A resonator with low power consumption and a tuning fork shaped crystal blank. Common application includes watches and mobile phones.

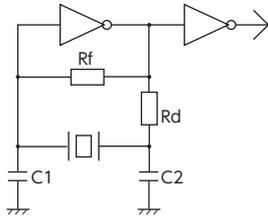

Terminology

Fundamental Crystal Resonators	Crystal resonator designed to oscillate in the lowest-order (fundamental) oscillation mode.
Overtone Crystal Resonators	Crystal resonator designed to oscillate in the overtone oscillation mode (third, fifth, and seventh).
Overtone Order	Desired order of vibration mode, (odd) integer multiples of the fundamental mode.
Vibration Mode	One factor which determines the mechanical vibration behavior of a crystal blank is cutting angle. Examples of such vibration behaviors are thickness-shear mode and flexure mode.
Nominal Frequency	The specified center frequency of the crystal.
Load Capacitance	The effective external capacitance that determines the resonance frequency of a crystal resonator. When this capacitance is small, the crystal resonator is vulnerable to changes in the circuit characteristics, thus deteriorating the frequency stability.
Drive Level	Loading condition of crystal resonator, which is determined by electric current or power applied to the crystal blank. Electric power P is determined by the following equation: $P = I^2 \cdot R_1$, where I represents electric current and R1 represents series resistance.
Series Resistance	The resistance of the crystal at the series resonance frequency, also called the equivalent series resistance (ESR).
Frequency Tolerance (Crystal Resonators)	Allowable deviation from nominal at room temperature (25 deg.C), indicated in parts per million ($\times 10^{-6}$).
Frequency Characteristics over Temperature (Crystal Resonators)	Allowable deviation of frequency at room temperature, in parts per million ($\times 10^{-6}$). This is the maximum value within the operating temperature range.
Aging	The frequency change of the crystal operated at specific conditions for a certain period of time.
Operating Temperature Range	Temperature range over which the crystal resonator can be operated within allowable deviation range.
Storage Temperature Range	Temperature range, which crystal resonator can be stored at without any deterioration or damage independently.
Turnover Temperature	The temperature at the peak of the parabolic curve that a crystal in kHz shows with temperature. It is expected that the crystal will have a steady oscillation if the peak temperature is within the working temperature range.
Parabolic Coefficient	The temperature co-efficient of a parabolic curve shown in frequency vs. temperature.
Plastic-encapsulated (SMD) type	Crystal resonators encapsulated with resin.
Cylindrical type	Crystal resonators in cylindrical constructions, which are generally in kHz frequency range.
Equivalent Circuit to Crystal Resonator	<p>An equivalent circuit near the resonance point of the crystal resonator is shown below. It consists of a series circuit including series motional inductance (L1), series capacitance (C1) and series resistance (R1), with the resonator's terminal-to-terminal capacitance (shunt capacitance: C0) connected in parallel with the series circuit. The smaller the size of the resonator, the greater the average values of R1 and L1.</p> 

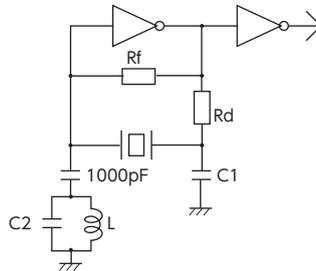

Oscillation Circuit

Oscillation Circuit of Crystal Resonator

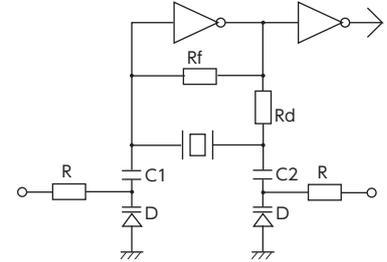

Oscillation Circuit of Fundamental Mode

Oscillation Circuit of Overtone Mode

VCXO Circuit

Oscillation Circuit of Fundamental Mode :

A circuit that allows the crystal resonator to oscillate in the fundamental mode.

Oscillation Circuit of Overtone Mode :

A circuit that allows the crystal resonator to oscillate in a high-order oscillation mode (overtone mode). (However, the circuit can be used at the composition of oscillation circuit of fundamental mode.)

VCXO Circuit :

An oscillation circuit with a frequency control function that utilizes the load capacitance characteristic of the crystal resonator.

Tips for Circuit Design

[IC Selection]

Selecting an IC according to the oscillation frequency.

- 〈Example〉 4069UB : From the kHz range to around 8 MHz
- 7WU04 : 4 to 30MHz
- 7WHU04 : 20 to 60MHz

[Feedback Resistance]

The feedback resistance for DC bias is necessary to continue the oscillation of a resonator. Generally, a resistance of 10 MΩ and above is used for oscillation in the kHz range, and a resistance of 1 MΩ and above is used for oscillation in the MHz range.

For overtone oscillation, a resistance of 1 kΩ may be used.

[Control Resistance]

Limits the current that flows into resonator, adjusts the negative resistance and drive level, prevents abnormal oscillation of resonator and suppresses frequency fluctuations.

[Capacitor C1, C2]

Adjusts the negative resistance and drive level, prevents abnormal oscillation of resonator.

[Bypass Capacitor]

This component is required to lower the impedance of the power-supply system inserted between the power-supply pin and ground pin of the IC. Mount as closely as possible to the IC, using a bypass capacitor with a capacitance suitable for the oscillation frequency.

- 〈Example〉 kHz range : 10 to 100 μF
- MHz range : 0.01 to 0.1 μF

[Line Pattern]

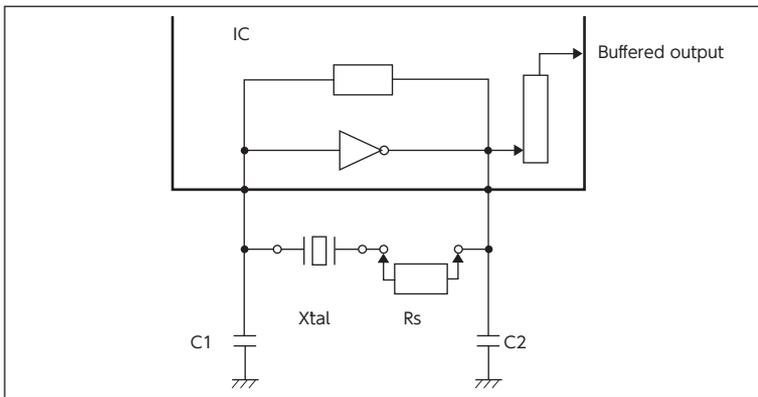

Mount parts of a oscillation circuit as closely as possible to the IC and don't put signal line of the oscillator circuit closely or cross another signal line.

Oscillation Circuit

Confirmation on Operation of Oscillation Circuit

[Negative Resistance]

As the figure shows, raise one end of the crystal resonator from the oscillation circuit and insert a resistor (R_s). Change the value of the inserted resistor (R_s). The value at which oscillation stops represents negative resistance. KDS measures the value not only at room temperature but also at low temperature, at high temperature and regards the lowest value as the negative resistance. The negative resistance value of the circuit should generally be at least five times the standard series resistance. It is recommended to provide a negative resistance that is at least ten times the standard series resistance for automotive applications and safety equipment.

Measurement Circuit for Negative Resistance

[Load Capacitance]

Minimize the difference of the oscillation frequency by making the load capacitance of a oscillation circuit and that of a resonator equal.

[Drive Level]

Absolute Maximum Value ; See “Drive Level” in the table of each page.
The adequate drive level differs according to the crystal resonator type and overtone order.

MHz Band Crystal Resonators

Fundamental Mode: 300 μ W max., 200 μ W max., 100 μ W max. Overtone Mode: 1mW max., 500 μ W max.

Tuning Fork Crystal Resonators

2 μ W max., 1 μ W max.

The smaller a resonator becomes, the tighter its specification becomes.

(Measurement Method)

Calculation based on the measured amperage flowing through a resonator and the resistance of that with a high-frequency current probe.

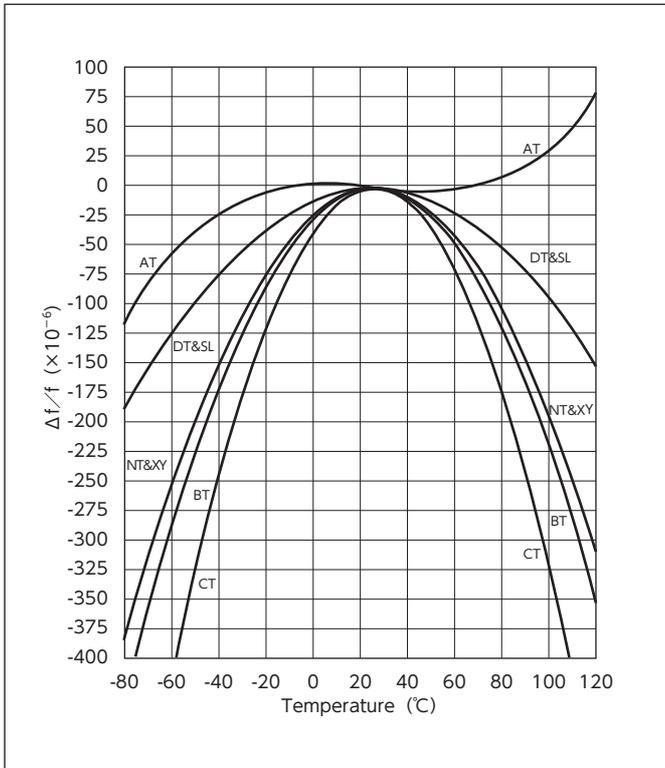

$$\text{Drive Level } P = (I/2\sqrt{2})^2 \cdot R$$

DSX321G (12MHz or under): 0.85mm
- Excellent heat resistance, High precision and high reliability
(Frequency aging specification of $\pm 1 \times 10^{-6}$ /1 year or $\pm 3 \times 10^{-6}$ /5 years is available for cell phone or wireless communication systems etc.)
- Offers a wide range of frequencies from 7.9MHz up to 64MHz.
- AEC-Q200 Compliant
- Fully lead free option available.
- Frequency Characteristics over Temperature $\pm 50 \times 10^{-6}$ / -40 to $+105^\circ\text{C}$ is available for Industrial Equipment.

RoHS Compliant

■ Applications

- Telecommunication products, short-range wireless modules and other small devices such as DVC, DSC, PC.
- Automotive applications such as Bluetooth, wireless LAN, GPS/GNSS, RKE (Remote Keyless Entry), safety controls and multimedia devices (AEC-Q200 Compliant)
- Industrial equipment

Crystal Oscillators

Description

● Simple Packaged Crystal Oscillators (SPXO)

SPXO is an oscillator for clock, which uses crystal resonance to create an electrical signal with a more precise frequency and are suitable for clock signal generators.

● Voltage Controlled Crystal Oscillators (VCXO)

These crystal oscillators have a variable-capacitance diode inserted into a SPXO oscillation loop, and enables the oscillation frequency to change by varying the voltage of the external power supply. The temperature characteristic of these oscillators are equivalent to those of the SPXO loop and takes advantage of the good attributes of crystal resonators.

● Temperature Compensated Crystal Oscillators (TCXO)

These high-precision crystal oscillators have a built-in circuit that corrects frequency variations resulting from temperature variations of the crystal resonator. It is optimal for applications where small frequency tolerance is required across a wide temperature.

● Oven Controlled Crystal Oscillator (OCXO)

OCXO is a super high-precision crystal oscillator with very small frequency variations by a built-in thermostatic bath, to maintain a constant temperature of the crystal resonator.

Available to the frequency reference, such as instruments and infrastructure base stations.

● Real Time Clock Module (RTC)

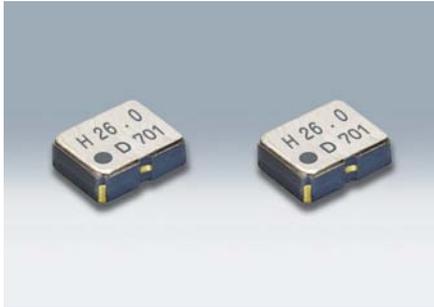

RTC is a high-precision crystal application product with built-in tuning-fork crystal oscillator, has an interrupt function and data provide function necessary for calendar clock function, such as year, month, day, hour, minute and second.

Terminology

Output Frequency	Nominal value of output frequency of a crystal controlled oscillator.
Frequency Tolerance (Crystal Oscillators)	The maximum permissible deviation of the oscillator frequency from a specified nominal value, when operating under specified condition.
Frequency Characteristics over Temperature (Crystal Oscillators)	Deviation from the frequency at the specified reference temperature due to operation over the specified temperature range, when other conditions remain constant.
Frequency Stability vs. Supply Voltage	Deviation from the frequency at the specified supply voltage due to operation over the specified range, when other conditions remain constant.
Frequency Stability vs. Load Variation	Deviation from the frequency at the specified load conditions due to changes in load impedance over the specified range, when other conditions remain constant.
Frequency Stability vs. Aging	The rate of output frequency change when an oscillator is operated under a specified condition and operating time.
Operating Temperature Range	Temperature range over which the crystal oscillator can be operated within allowable deviation range.
Supply Voltage	The DC input voltage necessary for oscillator operation.
Current Consumption	Operating current consumption.
Stand-by Current	The current consumption, when the oscillator stops oscillating by the control voltage applied to the control pin of an oscillator having the output control function.
Start up Time	The duration from the oscillation start until it reaches the specified output amplitude after power was applied.
Load Condition	Types or the number (capacity) of loads that can be connected to the oscillator.
Output Level	Amplitude of output waveform.
Rise Time	The time interval required for the leading edge of a waveform to change between two defined levels.
Fall Time	The time interval required for the trailing edge of a waveform to change between two defined levels.
Symmetry	The ratio between the time, in which the output voltage is above a specified level, and time in which the output voltage is below the specified level, in percent of the duration of the full signal period.
Output Disable Time	Time lag between control-signal input and oscillation output, where oscillation output is on. Specified for models with output control function.
Output Enable Time	Time lag between control-signal input and oscillation output, with oscillation output switched off (no output load). Specified for models with output control function.
3-state	The situation that the output goes to a high impedance when an oscillator stops oscillating by the standby function.
Phase Noise	The generic designation of the unwanted emission of energy around the nominal frequency generated by an oscillator.
Phase Jitter	The phenomenon when the phase of the pulse wave of the output signal of an oscillator moves back and forth in time from its ideal position. It is called jitter when the frequency fluctuations of the phase in time is over 10Hz.
Harmonics	Unwanted frequency component, which is higher than the desired output frequency of an oscillator.
Frequency Adjustment Range	The output frequency range which can be shifted by the control voltage from outside to VCXOs.
Frequency Control Voltage	The range of input voltage from outside to shift the frequency of VCXOs.

DSO1612AR

Actual size DSO1612AR □

■ Features

- 1612 size, 0.5 mm height. Ultra miniature and lightweight SMD SPXO
- 3-state function
- AEC-Q100/AEC-Q200 compliant
- Supply Voltage : 1.8V/2.5V/2.8V/3.0V/3.3V
- Available frequency range : 0.584375 to 80MHz
- Available up to 80MHz by using AT cut fundamental resonator. Low jitter provides for high performance.

■ Applications

SMD Differential Output Voltage Controlled Crystal Oscillators

DSV753SV/DSV753SB/DSV753SK/DSV753SJ/DSV753SD

Actual size

■ Features

- 7.3×4.9×1.5mm size miniature SMD-VCXO(0.06cc)
- Available with four types of output function:CMOS, LV-PECL, LVDS, HCSSL
- Differential output(LV-PECL, LVDS, HCSSL)
- Low jitter
- 3-state function

■ Applications

- Optical transmission device,radio transmitter-receiver equipment,digital image devices and HDTV.

SMD Tuning Fork Crystal Resonators / kHz Band Crystal Resonators (For Automotive)

DMX-26S

Actual size

■ Features

- AEC-Q200 Compliant
- RoHS/ELV Compliant

■ Applications

- Automotive multimedia devices

RoHS/ELV Compliant

■ Standard Specification

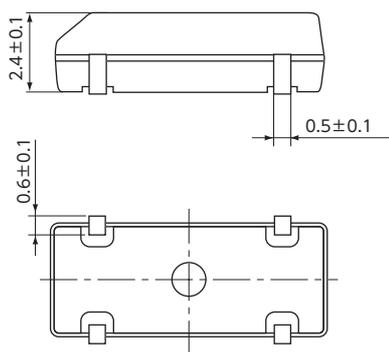

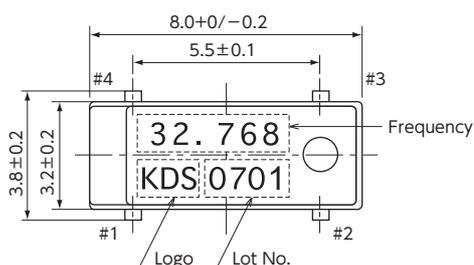

Item	Type	DMX-26S
Frequency Range		32.768kHz (30 to 90kHz)
Load Capacitance		7pF, 9pF, 12.5pF
Drive Level		1.0μW (2.0μW max.)
Frequency Tolerance		±20×10 ⁻⁶ (at 25°C)
Series Resistance		50kΩ max. (-40 to +85°C) 80kΩ max. (-40 to +125°C)
Turnover Temperature		+25°C±5°C
Parabolic Coefficient		-0.04×10 ⁻⁶ / °C ² max.
Operating Temperature Range		-40 to +85°C / -40 to +125°C
Storage Temperature Range		-40 to +125°C
Shunt Capacitance		1.25pF typ.
Reliability		AEC-Q200
Packing Unit (1)		2500pcs./reel(φ330)

(1) Moisture prevention packing is unnecessary.
Moisture Sensitivity Level: Level 1 (IPC/JEDEC J-STD-033)

SMD Low Phase Noise Crystal Oscillators (For Automotive)

DSO211AH

Actual size

■ Features

- Supply Voltage: 1.8V/2.5V/2.8V/3.0V/3.3V
- Low phase noise: $f_{out} \pm 1\text{kHz}$ $-145 \text{ dBc/Hz(Typ.)}$
 $f_{out} \pm 100\text{kHz}$ $-158 \text{ dBc/Hz(Typ.)}$
- Low profile: 0.72mm
- AEC-Q100/AEC-Q200 Compliant
- 3-state function

■ Applications

- Multimedia devices such as car navigation systems and car audio
- Automotive radio applications such as Bluetooth, wireless LAN and automotive camera

■ Features

- Supply Voltage: 1.8V/2.5V/2.8V/3.0V/3.3V/5.0V
- 3-state function
- Low current consumption
- CMOS Level Output
- High speed start-up: 2ms max. until frequency output after power on
- Stable frequency variation realized by adopting an At cut resonator
- AEC-Q100/AEC-Q200 compliant

Features

- Available frequency range : 32.768kHz, 1.049 to 8.5MHz
- Supply Voltage: 1.8V/2.5V/2.8V/3.3V
- 3-state function
- Low current consumption: 10μA typ.(32.768kHz)
- CMOS Level Output
- Stable frequency variation realized by adopting an At cut resonator
- AEC-Q100/AEC-Q200 compliant

Applications

- Multimedia devices such as car navigation systems and car audio

Monolithic crystal filters

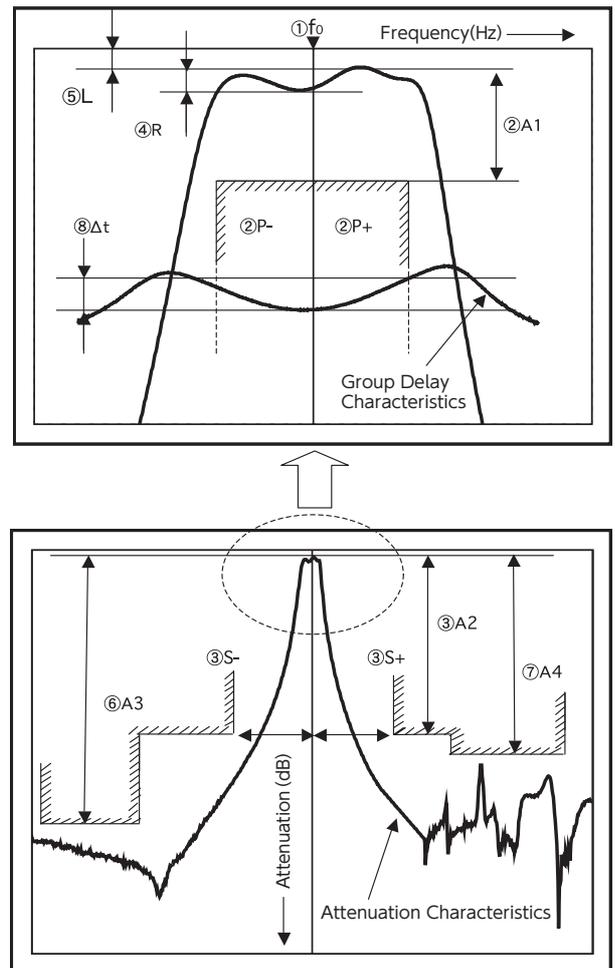

Monolithic Crystal Filters

Description

A monolithic crystal filter is a device that has a frequency screening function. From a wide frequency range, it passes a specific frequency and attenuates unnecessary ones. It plays the role of extracting desired frequency in radio communication equipment. With the high Q factor of the crystal, these filters feature low loss, steep attenuation characteristics and high stability, as well as good temperature drifting characteristics.

Terminology

①	Nominal Frequency f_0 (MHz)	Nominal value of center frequency.
②	Pass Bandwidth $P \pm$ (kHz), A_1 (dB)	Frequency interval at which relative attenuation is guaranteed to be equal to or less than a given value, A_1 .
③	Stop Bandwidth $S \pm$ (kHz), A_2 (dB)	Frequency interval at which relative attenuation is guaranteed to be equal to or more than a given value, A_2 .
④	Ripple R (dB)	The maximum difference between the minimum attenuation and the minimum loss within the pass band.
⑤	Insertion Loss L (dB)	Difference in attenuation when filter is inserted and not inserted. Can be either of the following. Minimum loss: Minimum value of insertion loss. Insertion loss at f_0 : Insertion loss at nominal frequency.
⑥	Guaranteed Attenuation A_3 (dB)	Relative attenuation guaranteed in a specific range within the stop band.
⑦	Spurious A_4 (dB)	Relative attenuation produced as a result of spurious frequencies in a specific range within the stop band.
⑧	Tolerance in Group Delay Time Δt (μs)	Difference between the maximum value and minimum value of the group delay time within the pass band.
Terminating Impedance $R_t // C_t$ ($\Omega // pF$)		Signal-source impedance or loading impedance as viewed from the filter side. Expressed as resistance and parallel capacitance including floating capacitance.
Coupling Capacitance C_c (pF)		Capacitance of the connection between elements for 4pole filter.
Operating Temperature Range		Temperature range over which the monolithic crystal filter can be operated within allowable deviation range.

Description

Crystal has wider transmission wavelength range of the light compared to common glass, and is physically stable material. In addition, it has depolarization properties, optical rotation property and double refraction properties that separates the ordinary and extraordinary light. It is used for wave plate, heat dissipation plate, OLPF (Optical Low Pass Filters).
The dielectric multilayer film can control the transmission of the light and is used in various electronic and optical devices. It can be formed on the various kinds of substrates, such as crystal, glass, etc.

■ Applications

- Surveillance camera, FA cameras, cameras for automotive electronics, action camera, digital still camera, video camera.

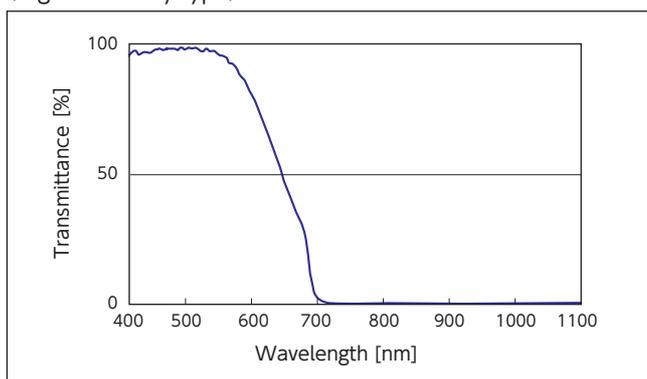

IR Double Cut Filter (IR Cut Filter)

"IR Double Cut Filter" is designed with the absorptive material and coating which blocks the transmission of the infrared. It comes with improved transmittance rate at visible light range, blocks near infrared light range and reduces the flares.

Optical Products

Dual Pass Filters (Dual Band Pass Filters)

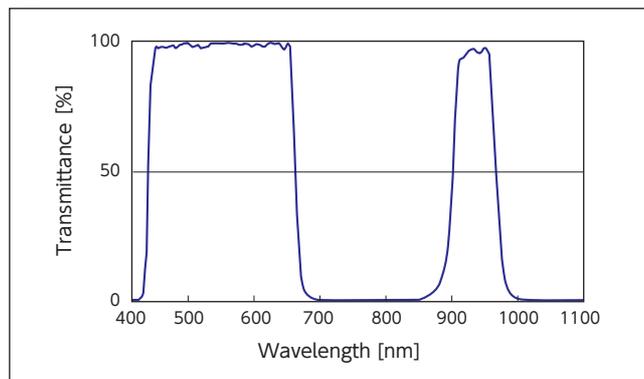

"Dual Pass filter" is a filter that has a transmission range of the near-infrared region and the visible light region. This filter is suitable to the surveillance cameras for shooting day and night continuously.

32 kHz MEMS Oscillators / 32 kHz TC-MO - μ Power

MO1532/MO1552/MO1630/MO1566/MO1568

■ Features

- Fixed 32.768 kHz
- Ultra-low power
- Internal filtering eliminates external Vdd bypass cap

■ Applications

- Mobile Phones, Tablets
- Health and wellness monitors, Fitness Watches
- Pulse-per-second timekeeping, RTC reference clock
- Battery Management Timekeeping

[1]. Measured peak-to-peak. Inclusive of Initial Tolerance at +25° C, and variations over operating temperature, rated power supply voltage and load. Stability is specified for two operating voltage ranges. Stability progressively degrades with supply voltage below +1.5V.

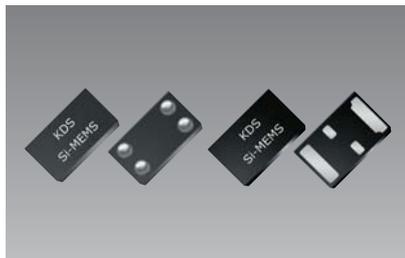

[2]. Measured peak-to-peak. Tested with Keysight 53132A frequency counter. Due to the low operating frequency, the gate time must be \geq 100 ms to ensure an accurate frequency measurement.

[3]. Core operating current does not include output driver operating current or load current. To derive total operating current (no load), add core operating current + (+0.065 μ A/V) \times (output voltage swing).

[4]. Measured from the time V_{dd} reaches +1.5V.

MEMS Oscillators - Low Power

MO8008/MO8009/MO2001/MO2002

■ Features

- Excellent total frequency tolerance as low as $\pm 20 \times 10^{-6}$
- Low power consumption of +3.5 mA typical (f = 20 MHz, Vdd = +1.8V)

■ Applications

- Ideal for DSC, DVC, DVR, IP CAM, Tablets, e-Books, SSD, GPON, EPON, etc.
- Ideal for high-speed serial protocols such as: USB, SATA, SAS, Firewire, 100M/1G/10G Ethernet, etc.

MEMS Oscillators - Super Low Jitter

MO9365/MO9366/MO9367

■ Features

- Industry-Standard packages: 3.2×2.5 mm, 5.0×3.2 mm, 7.0×5.0 mm
- Output signaling types: LVPECL, LVDS, HCSL
- Frequency tolerance as low as $\pm 10 \times 10^{-6}$
- 0.1 ps RMS phase jitter (random) for Ethernet applications

■ Applications

- 10/40GB Ethernet, SONET, SATA, SAS, Fibre Channel
- Telecom, networking, instrumentation, storage, servers

High Temperature MEMS Oscillators

MO8918/MO8919/MO2018/MO2019/MO8920/MO8921/MO2020/MO2021

■ Features

- Low power consumption of +3.5 mA typical (20 MHz, +1.8 V)
- Excellent total frequency tolerance as low as $\pm 20 \times 10^{-6}$

■ Applications

- High temp industrial equipment such as industrial control systems and industrial sensors
- Servo motor, PLC & High-temp networking gears
- Outdoor systems (medical and health monitoring)
- Asset tracking systems

[1]. All electrical specifications in the above table are specified with 15 pF output load and for all V_{dd}(s) unless otherwise stated.

[2]. The typical value of any parameter in the Electrical Characteristics table is specified for the nominal value of the highest voltage option for that parameter and at +25 °C temperature.

[3]. All max and min specifications are guaranteed across rated voltage variations and operating temperature ranges, unless specified otherwise.

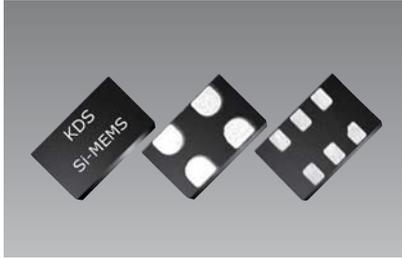

[4]. Initial tolerance is measured at V_{in} = V_{dd}/2.

[5]. Absolute Pull Range (APR) is defined as the guaranteed pull range over temperature and voltage.

[6]. APR = pull range (PR) - frequency tolerance (F_{stab}) - Aging (F_{aging})

Digitally Controlled MEMS Oscillators (DCMO)

MO3907/MO3921/MO3922

■ Features

- Industry-Standard packages:
3.2×2.5 (4-pin), 5.0×3.2 (6-pin), and 7.0×5.0 mm (6-pin)
- Digitally controlled pull range from ± 25 to $\pm 1600 \times 10^{-6}$
- Superior pull range linearity of ≤ 0.01 %

■ Applications

- Ideal for clock synchronization, instrumentation, low bandwidth PLL, Jitter cleaner, clock recovery, audio, video, and FPGA

KDS Global Network

Our global network accelerates our business.

All KDS business bases are connected through a global network via host computers. This network allows for online and real-time networking, thus maximizing time efficiency and ensures our promptness. This network maintains our quality standards through the control of production at our plants, product transport from/to the distribution center, and our sales information. In the best interest of our customers we continuously aim to deliver our quality services to the world market.
